WHM & cPanel Hosting

Project Documentation | AlmaLinux

1. About the project

I installed and configured WHM and cPanel on an AlmaLinux server to provide a web-hosting control panel environment. I use the hostname server.mahfuj.bd to access WHM and cPanel remotely.

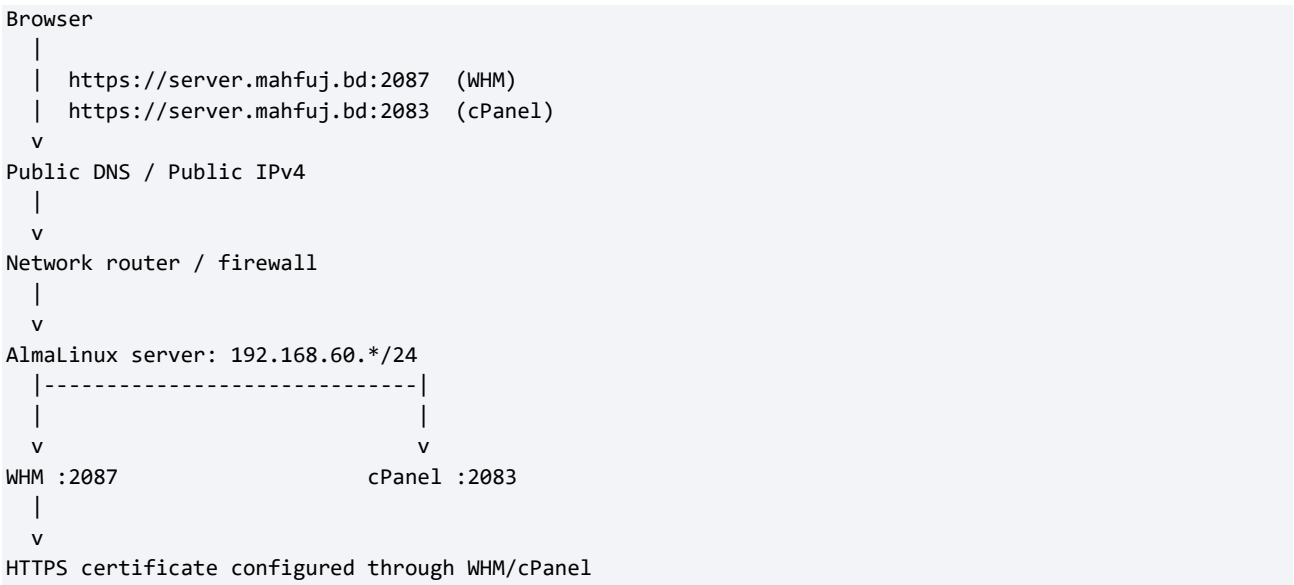

I configured HTTPS through WHM/cPanel itself. I did not configure Nginx Proxy Manager for this service, and NPM is not part of the HTTPS setup described in this document.

2. Project details

Item	Configuration
Operating system	AlmaLinux
Control panel	WHM & cPanel
Hostname	server.mahfuj.bd
WHM secure access	TCP 2087
cPanel secure access	TCP 2083
Server private address	192.168.60.*/24 (masked)
Actual server address	Hidden in this document
DNS provider	Cloudflare
HTTPS / SSL	Configured through WHM/cPanel
Nginx Proxy Manager	Not used or configured for this service

3. Network and access overview

The public DNS record for server.mahfuj.bd points to my public IPv4 address. Incoming connections reach the AlmaLinux server through the network/router configuration. WHM and cPanel provide their own secure web interfaces on ports 2087 and 2083.

4. DNS configuration

In Cloudflare, I configured an A record for server.mahfuj.bd to resolve to the public IPv4 address assigned to my connection. The public DNS record points to the public address, not to the private server address.

The private IP address is intentionally masked in this document as 192.168.60.*/24.

5. HTTPS / SSL configuration

HTTPS is configured on the WHM/cPanel server. I did not create an SSL certificate or configure HTTPS in Nginx Proxy Manager for this hostname.

WHM and cPanel are accessed over their standard secure ports. The certificate presented by the service should be checked in the browser to confirm that it matches server.mahfuj.bd and is valid.

6. Service URLs

Service	URL
WHM	https://server.mahfuj.bd:2087
cPanel	https://server.mahfuj.bd:2083

7. Security and maintenance

- Use strong and unique passwords for WHM, cPanel and server accounts.
- Enable multi-factor authentication where available.
- Keep AlmaLinux and WHM/cPanel updated.
- Expose only the ports required for the services in use.
- Review WHM access controls and restrict access by source IP where practical.
- Monitor certificate validity and renew or repair the service certificate when required.
- Maintain regular backups and periodically verify restore procedures.

8. Scope and privacy note

This document covers only the WHM and cPanel deployment on AlmaLinux. Nginx Proxy Manager was not configured for this service. The actual private IP address is hidden and represented as 192.168.60.*/24.
